and

and

A good system identification method should return models accompanied by certificates guaranteeing the quality of the model

and

A good system identification method should return models accompanied by certificates guaranteeing the quality of the model

- $\| heta^o \widehat{ heta}\| \le 0.1$
- $y_{t+1} \in \text{region } \hat{Y}$ with probability 99%

and

A good system identification method should return models accompanied by certificates guaranteeing the quality of the model

Certificates are relevant to the practice of system identification, and are necessary for its scientific use

System identification relies on data, and data is the real wealth in a system identification procedure

System identification relies on data, and data is the real wealth in a system identification procedure

therefore

System identification relies on data, and data is the real wealth in a system identification procedure

therefore

A system identification method should squeeze out all the relevant information contained in the data, for the purpose of constructing models and of certifying their quality

This talk is about data, and the quality of models obtained using data

This talk is about data, and the quality of models obtained using data

N data points

This talk is about data, and the quality of models obtained using data

probability exists, but probability values do not count

we should look for distribution-free results

paradigm shift

A journey through:

$$y_t = \theta^O + n_t$$

$$\frac{t \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9 \mid 10}{y_t \mid 0.56 \mid -0.66 \mid 1.12 \mid 1.32 \mid -0.14 \mid 2.25 \mid -0.21 \mid 0.96 \mid 1.28 \mid 1.17 \mid 1.17$$

$$y_t = \theta^O + n_t$$

$$\frac{t \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9 \mid 10}{y_t \mid 0.56 \mid -0.66 \mid 1.12 \mid 1.32 \mid -0.14 \mid 2.25 \mid -0.21 \mid 0.96 \mid 1.28 \mid 1.17 \mid 1.17$$

$$y_t = \theta^o + n_t$$

$$t \parallel 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6$$

$$y_t = \theta^o + n_t$$

are we sure that $|n_t| \leq 2$?

$$y_t = \theta^o + n_t$$

Assumption:

$$n_t \sim {
m Gaussian}(0,1)$$

$$y_t = \theta^o + n_t$$

<u>Assumption:</u> $n_t \sim \text{Gaussian}(0, 1)$

LS estimate:

$$\hat{\theta}_{LS} = \frac{1}{10} \sum_{t=1}^{10} y_t = 0.76$$

$$y_t = \theta^o + n_t$$

<u>Assumption:</u> $n_t \sim \text{Gaussian}(0, 1)$

LS estimate:

$$\hat{\theta}_{LS} = \frac{1}{10} \sum_{t=1}^{10} y_t = 0.76$$

$$\theta^{o} - \widehat{\theta}_{LS} \sim \text{Gaussian}\left(0, \frac{1}{10}\right)$$

<u>Claim:</u> $\theta^{o} \in \Theta$ with probability 90%

are we sure that $n_t \sim \text{Gaussian}(0, 1)$?

a paradigm shift

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$y_t = \theta^o + n_t$$

$$\left[\sum_{t=1}^{10} (y_t - \theta)\right]^2 = \mathsf{TEST} \mathsf{PARABOLA}$$

$$y_t = \theta^o + n_t$$

$$\left[\sum_{t=1}^{10} (y_t - \theta)\right]^2 = \mathsf{TEST} \mathsf{ PARABOLA}$$

$$vertex = \frac{1}{10} \sum_{t=1}^{10} y_t = \hat{\theta}_{LS}$$

there is a lot of information in the data that traditional methods do not exploit

there is a lot of information in the data that traditional methods do not exploit

let the data speak!

$$y_t = \theta_1^o u_{t-1} + \theta_2^o u_{t-2} + n_t$$

TEST PARABOLA =
$$\left\|\sum_{t=1}^{N} \left[\begin{array}{c} u_{t-1} \\ u_{t-2} \end{array} \right] (y_t - \theta_1 u_{t-1} - \theta_2 u_{t-2}) \right\|^2$$

vertex = $\hat{\theta}_{LS}$

n-th PARABOLA =
$$\left\|\sum_{t=1}^{N} \pm \left[\begin{array}{c} u_{t-1} \\ u_{t-2} \end{array}\right] (y_t - \theta_1 u_{t-1} - \theta_2 u_{t-2})\right\|^2$$

....

•
$$A^{o}(z^{-1})y_{t} = B^{o}(z^{-1})u_{t} + n_{t}$$

•
$$A^{o}(z^{-1})y_t = B^{o}(z^{-1})u_t + n_t$$

•
$$y_t = G^o(z^{-1})u_t + H^o(z^{-1})n_t$$

$y_t = 0.6u_{t-1} + 0.8u_{t-2} + n_t$ $u_t = 0.8u_{t-1} + v_t$

Example

$$y_t = 0.6u_{t-1} + 0.8u_{t-2} + n_t$$
$$u_t = 0.8u_{t-1} + v_t$$

Example

$$y_t = 0.6u_{t-1} + 0.8u_{t-2} + n_t$$
$$u_t = 0.8u_{t-1} + v_t$$

... mid-talk summary

<u>Claim:</u> $\theta^o \in \Theta$

deterministic

<u>Claim:</u> $\theta^o \in \Theta$

set-theoretic statement

deterministic

<u>Claim:</u> $\theta^o \in \Theta$

set-theoretic statement

rigid deterministic assumptions

Mark Twain: "what gets us into trouble is not what we don't know. It's what we know for sure that just ain't so."

a probability is needed to tackle the challenge of being quantitative

<u>Claim:</u> $\theta^{o} \in \Theta$ with probability 90%

<u>Claim:</u> $\theta^{o} \in \Theta$ with probability 90%

strong probabilistic priors are used

Jan Willems: "where would the numerical values of this probability come from?"

<u>Claim:</u> $\theta^{o} \in \Theta$ with probability 90%

<u>Claim:</u> $\theta^{o} \in \Theta$ with probability 90%

▶ 90%

<u>Claim:</u> $\theta^{o} \in \Theta$ with probability 90%

A journey through:

- parameter estimation
- prediction
- filtering

A journey through:

• parameter estimation

• prediction

• filtering

do we really believe in these priors?

a paradigm shift

no assumptions

min rsubject to: $|y_i - [\alpha + \beta u_i + \gamma u_i^2]| \le r, \quad i = 1, \dots, 19$

[Campi, Calafiore, Garatti, Automatica, 2009]

[Campi, Calafiore, Garatti, Automatica, 2009]

<u>Claim</u>: The prediction is correct with exact probability 80%, irrespective of the probability with which data are generated

<u>Claim</u>: The prediction is correct with exact probability 80%, irrespective of the probability with which data are generated

totally distribution-free!

Theorem [Campi, Calafiore, Garatti, Automatica, 2009]

k = degrees of freedom of centerlineN = # of data points

The layer predicts correctly with exact probability \boldsymbol{p} if

$$N = \frac{k+p}{1-p}$$

Theorem [Campi, Calafiore, Garatti, Automatica, 2009]

k = degrees of freedom of centerlineN = # of data points

The layer predicts correctly with exact probability \boldsymbol{p} if

$$N = \frac{k+p}{1-p}$$

$$p = 80\%$$
 \Rightarrow $\frac{k+p}{1-p} = \frac{3+0.8}{1-0.8} = 19$

why is this possible?

a simple predictor can be reliable for complex data generation mechanisms

"thickness"

u

 "reliable" is a property with 2 arguments: reliable(model, data generation mechanism);

- "reliable" is a property with 2 arguments: reliable(model, data generation mechanism);
- "thickness" is a property with 1 argument: thickness(model).

- "reliable" is a property with 2 arguments: reliable(model, data generation mechanism);
- "thickness" is a property with 1 argument: thickness(model).

So: thickness can be inspected, while reliability has to be guaranteed by a theory valid <u>under general</u> <u>assumptions</u>.

[Campi, Machine Learning, 2010]

example: defibrillation

[Campi, Machine Learning, 2010]

much remains to be done in prediction:

- more general constructions
- dynamical case

A journey through:

- parameter estimation
- prediction
- filtering
